

Roger Han

Lead Mobile Engineer | Native iOS, React Native, performance, AI-assisted delivery | Auckland, New Zealand
roger.hanhong@gmail.com | 021 114 7182 | App Store apps available on request

PROFESSIONAL SUMMARY

Mobile engineer with 10+ years of native iOS experience building, shipping, and maintaining production apps in Swift, SwiftUI, UIKit, async/await, and MVVM-Coordinator architecture. Strong fit for Lead Mobile Engineer roles that need deep iOS judgement inside a modern React Native or cross-platform mobile codebase: native integration, app architecture, performance, release quality, mentoring, and product-focused delivery.

Recently my focus has expanded into AI-assisted mobile development. I build apps from scratch to store release across iOS and Android using Expo/React Native and Flutter, and I design the specs, reusable agent skills, and review workflows that keep AI-assisted code readable, tested, and production-quality.

CORE SKILLS

Languages: Swift, Objective-C, TypeScript/JavaScript.

Cross-platform mobile: Expo / React Native (Hermes, native modules, bridging to Swift), Flutter, native-platform feature mapping, shared design systems, platform-conditional UI.

Performance & reliability: responsive UI under load, frame/jank profiling, launch-time and memory optimization, graceful error handling, poor-network and real-world mobile conditions, battery-conscious engineering, crash/production troubleshooting, observability (analytics, crash reporting, PostHog/Logfire).

Mobile delivery / CI-CD: App Store Connect & Google Play submission, TestFlight, EAS Build/Submit, fastlane, code signing & provisioning, release risk analysis for new iOS/Xcode/SDK versions, GitHub Actions, production support and hotfix workflows.

Leadership: technical design ownership, mentoring, pairing, design & code reviews, cross-functional delivery with product/design/backend/QA, raising team quality bar while keeping delivery moving.

Native iOS: Swift, SwiftUI, UIKit, Combine, Swift Concurrency (async/await, actors, structured concurrency), MVVM-Coordinator, Clean/modular architecture, Swift Package Manager, app lifecycle, deep links/universal links, push notifications, widgets (WidgetKit), Keychain, Instruments profiling, memory/leak debugging.

Architecture & API integration: REST/GraphQL, networking layers, state management, OAuth/auth flows (Clerk, OAuth providers), in-app purchases & subscriptions (RevenueCat, StoreKit, Stripe), offline/local persistence, dependency injection, feature flags.

Quality & testing: unit/integration tests (XCTest, Vitest, Jest), UI/E2E automation (Maestro), MCP-connected E2E test workflows, static analysis & security scanning (semgrep), testable architecture, code review discipline.

AI-assisted engineering: spec-driven / Speckit workflows, reusable agent skills authoring, LLM code generation and auto-fix loops, MCP server & tool design, prompt/spec design, agent orchestration, review gates that keep AI-assisted code readable, tested, and production-quality. Working with Claude, GPT, and Gemini model families and the Anthropic/OpenAI/Google SDKs.

PROFESSIONAL EXPERIENCE

Fiserv — Auckland, New Zealand

Sep 2014 – Present

Mobile Application Developer — Tech Lead

Mar 2022 – Present

- Lead technical design for new mobile features, translating product requirements into maintainable iOS architecture and delivery plans.
- Build and review native iOS features with Swift, SwiftUI, async/await, UIKit, and MVVM-Coordinator patterns.
- Drive release readiness through risk analysis for new iOS, Xcode, and SDK versions before rollout.
- Mentor engineers through design reviews, code reviews, and pairing, raising quality while keeping delivery moving.
- Take ownership of features from architecture and implementation through release, production support, and follow-up fixes.
- Main contributor to the team's Speckit-based agentic development workflow: authored specs, reusable skills, and developer guidance that made AI-assisted output reviewable and trustworthy.
- Turned ad-hoc AI prompting into explicit specs, implementation steps, and review expectations so the team can ship AI-assisted changes to production with stronger confidence.

Senior Software Developer

Sep 2018 – Mar 2022

- Delivered production iOS applications from feature development through release and iteration.
- Implemented mobile UI, networking, state management, authentication flows, and backend integrations.
- Used fastlane and related CI/CD tooling to reduce manual release work and make signing/build steps more reliable.
- Collaborated with product, design, backend, QA, and support teams to ship under tight deadlines while keeping quality visible.
- Supported production issues and release troubleshooting across the mobile app lifecycle.

Intermediate Software Developer

Jun 2016 – Sep 2018

Junior Software Developer

Sep 2014 – Jun 2016

Zeald — Auckland, New Zealand

Jun 2014 – Sep 2014

Frontend Web Developer

Jun 2014 – Sep 2014

- Built responsive frontend web interfaces and integrations as part of a digital agency delivery team.

SELECTED AI / MOBILE PROJECTS (OUTSIDE OF WORK)

Over the last few months I have devoted the majority of my time to building AI-driven mobile products end to end across iOS and Android.

Appifex — AI App Builder · live on the App Store

Expo / React Native · RevenueCat + Stripe · Clerk OAuth

apps.apple.com/nz/app/appifex-ai-app-builder/id6756634170

- Built and shipped a production React Native app that turns a plain-English prompt into a working full-stack app with live preview, shareable links, and source export.
- Integrated RevenueCat and Stripe for in-app purchases/subscriptions, and Clerk OAuth for authentication.
- Implemented home-screen widgets, production deploy to App Store / Vercel, and the full submission + review path solo.
- Carried the app from scratch through App Store review to a released product.

appifex-dtc — Design-to-App CLI · open source

TypeScript · pnpm monorepo · MCP server

github.com/appifex-ai-org/appifex-dtc

- Built a CLI that generates compilable, linted native mobile apps from design files (Pencil / Figma / Stitch) — "design to TestFlight in one command."
- Encodes native best practices for both platforms: SwiftUI on iOS and Kotlin Compose on Android, via design tokenization, platform spec generation, test scaffolding, LLM code generation, compile/validate, auto-fix loops, and store deploy.
- Added validation gating (Maestro UI tests, semgrep security scans) and checkpoint-based resume (SQLite) so interrupted runs continue without restarting.
- Exposed pipeline stages as MCP tools for AI-agent orchestration.

Cross-platform AI work — Flutter & React Native

- Shipped AI features across Flutter and Expo/React Native alongside native iOS, building scratch-to-store on both iOS (App Store) and Android (Google Play).
- Used MCP-connected E2E testing workflows to make AI-assisted changes safer and easier to verify.

EDUCATION

Bachelor of Science, Computer Science — The University of Auckland

2011 - 2014

TARGET ROLE FIT

Best fit: Lead Mobile Engineer, Senior iOS Engineer, Mobile Tech Lead, or AI-enabled mobile product engineer roles where native iOS depth, React Native/platform integration, performance, release experience, mentoring, and practical AI workflow adoption matter.
